

Brain MRI Tumor Classification Report

Patient Name:	John Doe
Age:	30
Sex:	Male
Prediction:	Glioma
Confidence:	100.00%

Symptoms

Patient is experiencing severe headache.

Recommendations

A glioma diagnosis requires immediate consultation with a neurologist or neurosurgeon for further evaluation. Advanced imaging, such as contrast-enhanced MRI, should be performed to determine tumor size, location, and grade. Treatment options may include surgical resection, radiation therapy, chemotherapy, or targeted therapy. Regular follow-ups with MRI scans and neurological assessments are essential to monitor tumor progression.
